Read more...Electric guitars are used by many musicians. Typically, a player holds the guitar with one hand and uses the other hand to hold a pick. The pick is used to play a string on the guitar. Electric guitars usually have a body, a neck, and six strings. In some configurations, a player holds a pick in one of the hand and has the other hand free. When the player wants to play a string on the guitar, the free hand holds the pick in such a manner that the pick is held close to the strings. As the hand holding the pick moves away from the strings, the pick picks a string. When the pick moves back towards the strings, the pick is in contact with the strings and the pick plucks the strings. The player can adjust the tension of the strings by playing the strings. Typically, when a string is too loose or too tight, the player will loosen or tighten the string. However, if the pick is too close to the strings, the string will be hard to pluck. This can make it difficult to play a desired chord. Therefore, a need exists for a pick that has a feel similar to the feel of a plucked string on an acoustic guitar, but that can be held at a desired distance from the string. The invention is directed to solving these problems and other problems as summarized below.Kreuzkirchen-
